

Positioning Sensors for Running in a Maze

Ian Butterworth

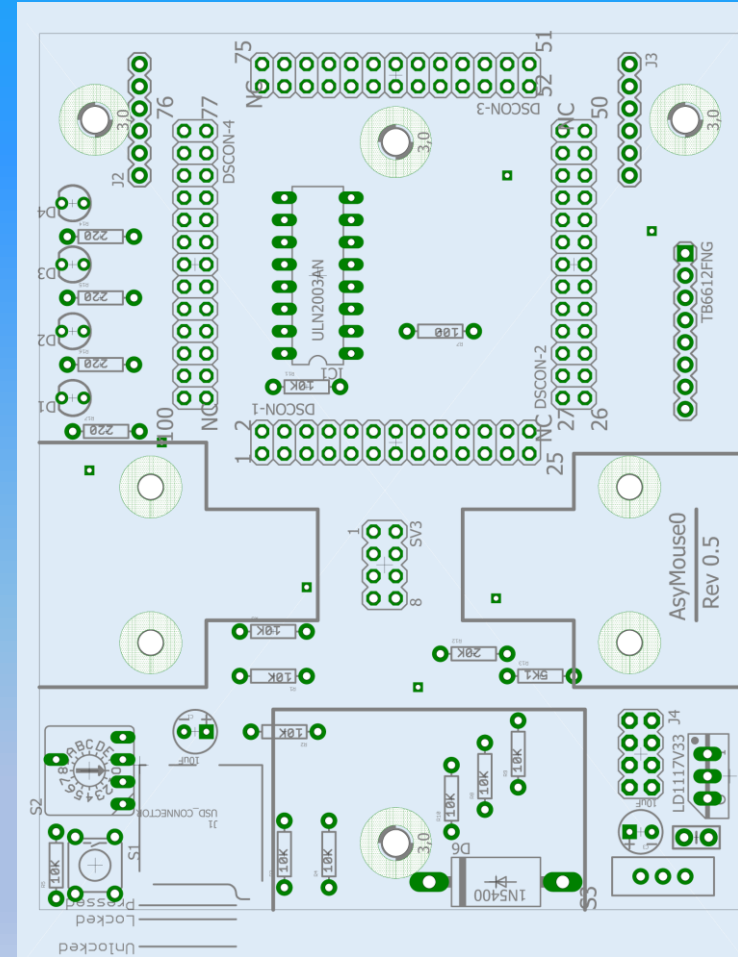

Positioning Sensors for Running in a Maze Situation

- Asymouse is dimensionally challenged!
- Motherboard is 100 x 80mm

Positioning Sensors for Running in a Maze Situation

- Sensor board using proto-board
 - Components further overhang the motherboard
 - Sensor board has to sit on top of large PIM
 - Off centre axle position means only 5mm clearance for turn around
 - Poor reliability in the maze

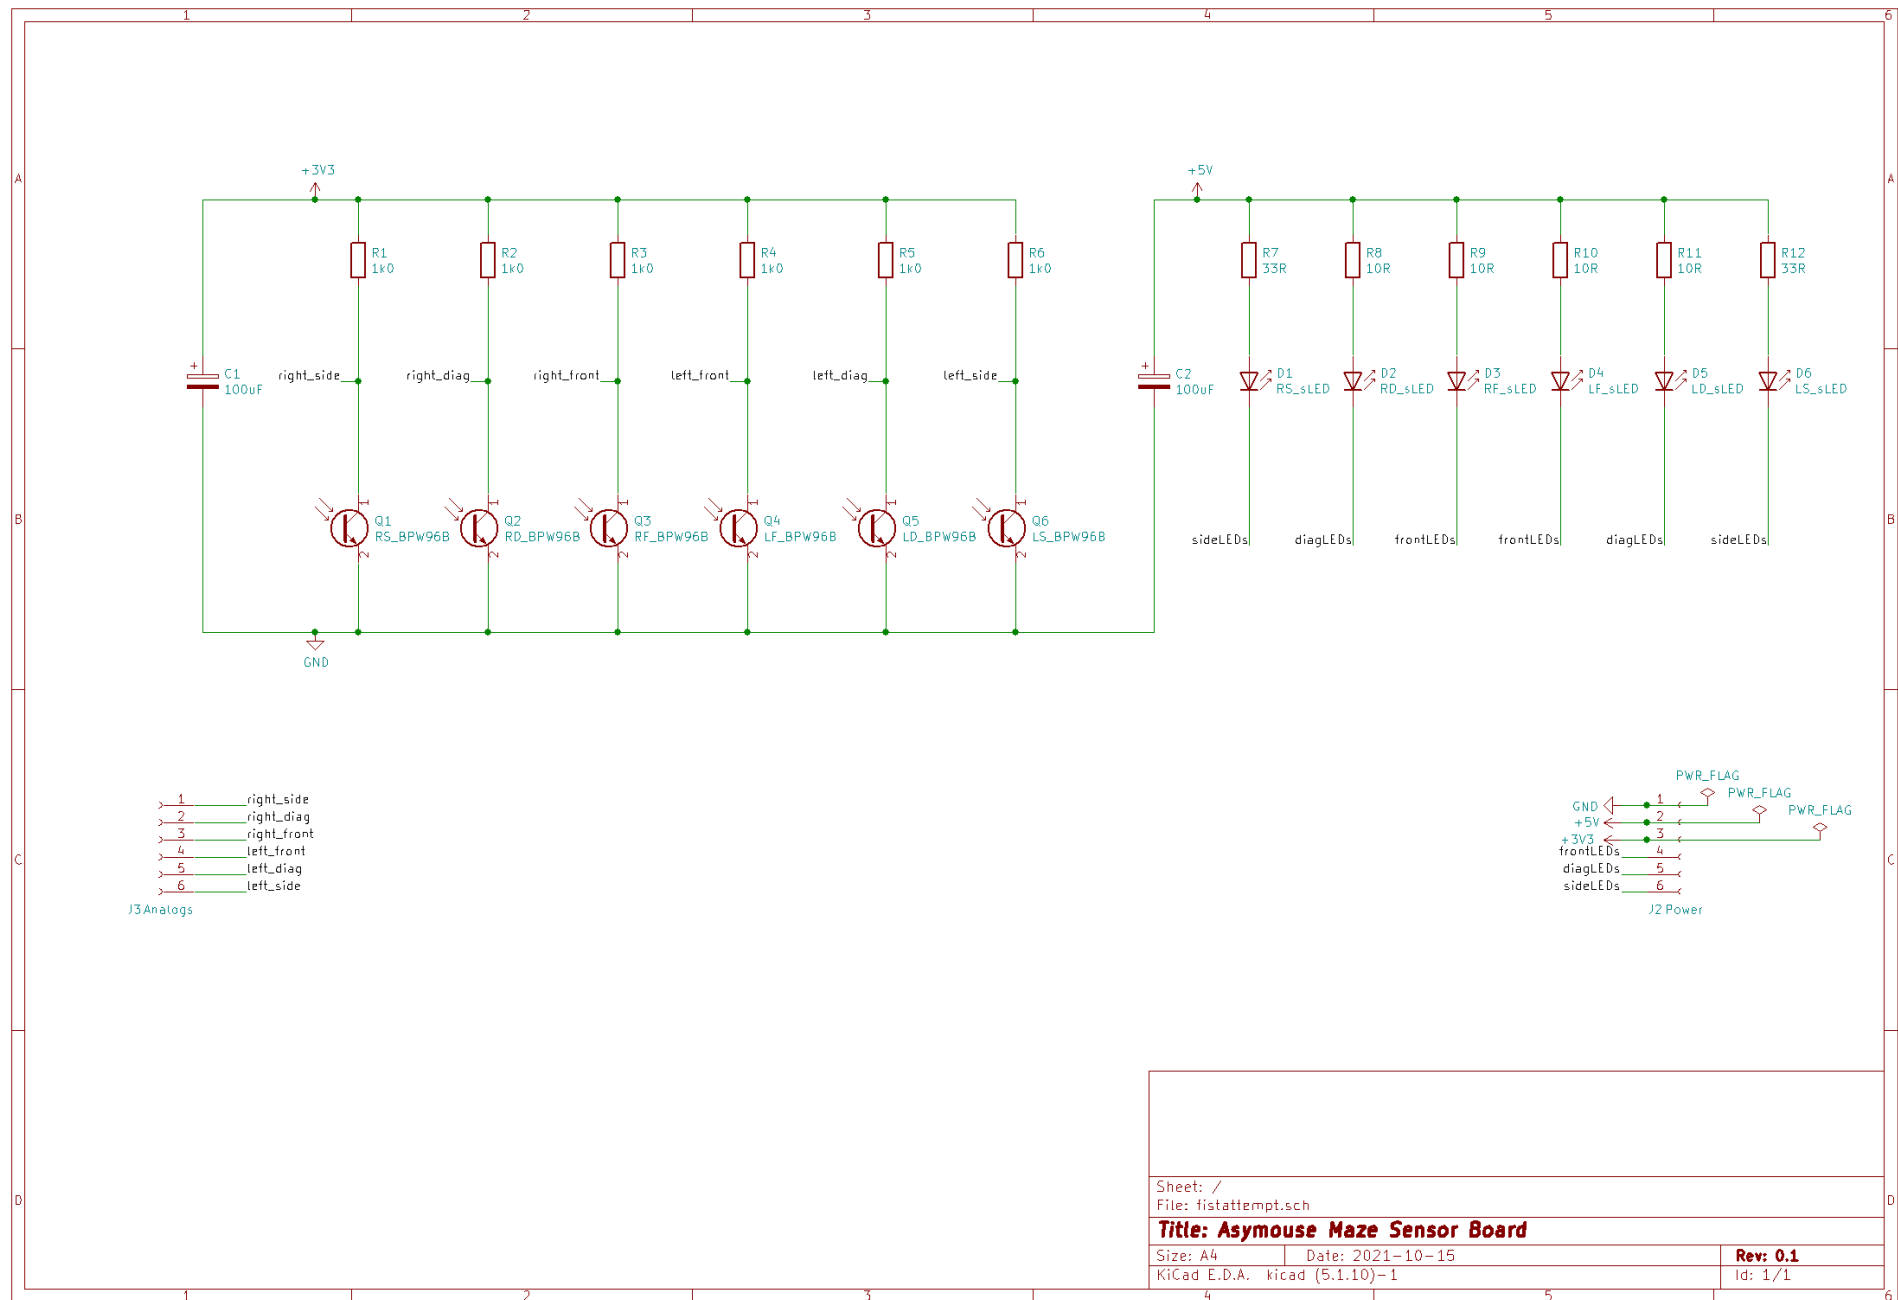

Positioning Sensors for Running in a Maze Task

- Improve reliability in the maze
- The sensors give good readings when not crashed
- 2 possible solutions:
 - Deliberately position off centre in a cell when preparing to turn around
 - Design and build a smaller sensor PCB
- Solution 1 improved reliability but not ideal
- Moved to solution 2

Positioning Sensors for Running in a Maze

Action

- Designed a new PCB with KiCad
- Fabricated in China

Positioning Sensors for Running in a Maze

Action

- New PCB
 - Board is 76mm wide
 - Overall width including sensors 89mm
 - Sensors within the front of the mother board
 - Distance from axle to front 65mm
 - Tolerance for centred turn around 19mm
- Old Board
 - Board is 81mm wide
 - Overall width including sensors 95mm
 - Sensors 13mm in front of the mother board
 - Distance from axle to front 78mm
 - Tolerance for centred turn around 5mm

Positioning Sensors for Running in a Maze

Results

- Foolishly I didn't think enough about the angle of the diagonal sensors
- 45° too far in front for steering

Positioning Sensors for Running in a Maze

Results

- Reduce the forward reach of the diagonal sensors
 - Switch diagonal and forward sensors
 - Reduce angle of diagonal sensors
